4.8

(a)

Work

First Derivative:

The only layer here is in the exponent of e; everything else is constant.

$$f(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}},$$

$$A = -\frac{x^2}{2}, \quad f(x) = \frac{1}{\sqrt{2\pi}} e^A$$

$$A' = \frac{d}{dx}\left(-\frac{x^2}{2}\right) = -\frac{1}{2}\left(2x^{2-1}\right) = -\frac{2x^{2-1}}{2} = -x.$$

$$\frac{1}{\sqrt{2\pi}} e^A \left(-x\right) = \frac{-x}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}.$$

Second Derivative

Because the first derivative was multiplicative, we need the product to get the second derivative.
Product rule: $f''(x) = g'(x)f(x) + g(x)f'(x)$.
$f(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$.
$f'(x) = \frac{-x}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$.
$g(x) = -x.$ $g'(x) = \frac{d}{dx}(-x) = -1.$

$$f''(x) = \left(\frac{x^2}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}\right) - \left(\frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}\right) = \left(\frac{x^2 - 1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}\right).$$

Plug in 0 for each version

$$f(0) = \frac{1}{\sqrt{2\pi}} e^{-\frac{0^2}{2}} = \frac{1}{\sqrt{2\pi}}.$$

$$f'(0) = \frac{0^2}{\sqrt{2\pi}} e^{-\frac{0^2}{2}} = 0.$$

$$f''(0) = \frac{0^2 - 1}{\sqrt{2\pi}} e^{-\frac{0^2}{2}} = \frac{-1}{\sqrt{2\pi}}.$$

Taylor approximation - just plug in what we found:

$$f(x) \approx \frac{1}{\sqrt{2\pi}} + 0x + \frac{-1/\sqrt{2\pi}}{2}x^2.$$

Which if we clean up and rearrange to the more recognizable quadratic form, looks like:

$$f''(x) \approx \frac{-1}{\sqrt{8\pi}}x^2 + \frac{1}{\sqrt{2\pi}}.$$
